

The Enerworks Solar water heating appliance is a reliable, year-round solution used in residential and small commercial applications, offsetting greenhouse gas emissions and saving money on your energy bill month after month and year after year. The Enerworks Solar heating appliance uses free solar energy to heat water, becoming your primary source of hot water. If necessary, your existing water-heater heats the water during periods of low solar radiation or at night, so you are never without hot water.

Just like our very own store model currently being used by us here at Higgins Energy Alternatives the panels resemble skylights and can be roof, wall or rack-mounted to ensure optimal solar energy capture. Within the Energy Station, the heat is transferred to your water, and is then ready to meet your hot water needs. The relatively simple process has significant economic and environmental benefits.

By heating your water with renewable solar energy rather than finite fossil fuels, you will reduce your carbon footprint on the environment, lower your utility bills year round, have the independence and security from the utility company you have always wanted. There are many incentive programs available right now to help offset the cost of your new solar system making this the best possible time ever to have one installed in your home or business. Please visit www.disre.org to see what programs are available in your area for cost savings.

Please contact us toll free at 1-800-424-6343 and speak with Tyson Mannix or by email at Tyson@higginsenergy.com with all of your questions.
